1. Summary

Metric	Value
Branch points (decision outcomes)	384
Branches taken	382
Branches never taken	2
Partially covered decisions	2
Branch coverage	**99.48 %**

A *branch* is one outcome of a decision (`if` , `while` , `for` , `try/except` , boolean short-circuit) as measured by coverage.py's arc analysis. A decision is *partial* when at least one of its outcomes was never executed.

2. Branch coverage by module

3. Branches not taken

Module	From line → to line	Meaning (source of the decision)
`vps/main.py`	84 → 80	jump to line 80 never taken: `if hasattr(mod, "router"):`
`vps/main.py`	128 → 130	jump to line 130 never taken: `if WEB_DIR.exists():`

4. Branch-focused test design

Boundary and decision tests written specifically to drive both outcomes of key decisions:

Decision	Tests driving each outcome
Grace period `minutes <= 15`	0, 1, 15 → free; 16 → charged (`test_grace_period_boundary`)
Daily cap `min(tiered, cap)` and 24 h blocks	3 h (under cap), 10 h/15 h (at cap), 26 h (1 day + 2 h)
Surge window `start <= hour < end`	exit 18:00 IST (in), 11:30 IST (out), rule disabled
Coupon kind / expiry / max uses	PERCENT, FLAT capped at gross, expired, exhausted, unknown

Decision	Tests driving each outcome
Reservation window	47.9 h accepted, 48.1 h and past rejected; check-in early / on time / late
No-show cut-off	start + 29 min (kept) vs + 31 min (released)
Barrier lower vs. loop occupied	occupied → halted; clear → auto-lower
Webhook	valid, bad signature, missing signature, amount mismatch, re-delivery, payment.failed
Edge queue	online forward, offline queue, flush while offline (no-op), 71 h vs 73 h budget
TLS requirement	https scheme, X-Forwarded-Proto https, plain HTTP → 426, /health exempt
